

Meeting Summary 15-04-24

The meeting started at 5:30 and ended at 5:51.

Chetan began the meeting by discussing the AWS instance and our progress since last year. We asked the client to scan with an Android phone by downloading the Expo Go app. We shared a QR code with them, and the app ran smoothly on the client's device. The client scanned a photo we showed, and the app functioned as expected.

We discussed the challenges associated with revamping the whole backend with a new algorithm and sought the client's opinion on which algorithm they prefer. The client was satisfied with the demo.

We mentioned our inability to update the APK due to time constraints and challenges working with APK.

We brought up the possibility of fixing the hardcoded part of the new algorithm provided by the client.

We requested that if there are any changes in the frontend or anything else, we should be informed before Friday. This is because we have the final presentation for the course coming up and won't be able to make changes afterwards as our documentation will depend on it. By Friday, all documentation will be finalized.

The client has two main points to report to the CEO:

1. The app ran perfectly on his phone.

2. He will inform the CEO about the image algorithm and any UI changes.
